

Ilenia Tinnirello: Curriculum Vitae

1. Personal Data

Name	Ilenia Tinnirello
Birth	Palermo, 28 November 1976
Nationality	Italian
Address	Fondo Marino, 5, Palermo – ITALY
Current Employment Address	Assistant Professor at Università di Palermo Dipartimento di Ingegneria Elettrica, Università di Palermo Viale delle Scienze, Parco D’Orleans, 90128 Palermo, ITALY
Telephone, fax	Tel:+39 091.23060251 Fax: +39 091.488456 Cell: 0320.4376527
Email	Email: ilenia.tinnirello@tti.unipa.it , ilenia.tinnirello@unipa.it

2. Education

- From June 2007 to July 2007: Visiting researcher at the Seoul National University, Seoul Korea.
- From June 2006 to August 2006: Visiting researcher at the Nanyang Technological University, Singapore.
- Since January 2005: Assistant Professor at the University of Palermo.
- From March 2004 to November 2004: Visiting researcher at the Seoul National University, Seoul, Korea.
- February 2004: Ph.D. dissertation about Resource Management in Wireless Packet Networks, advisor Prof. Giuseppe Bianchi
- January 2001: state examination for engineering professional qualification.
- Since November 2000: **PhD Student on Communications**, Università di Palermo. About the PhD formation program, she attended the International School for PhD Students on Information Engineering at Napoli Univeristy Federico II, on february 2001, 2002 and 2003 and, at Padova Univeristy on July 2001 e 2002. Moreover, she attended a course on sensor networks at Università la Sapienza di Roma, by prof. Mani Srivastava.
- April 2000: **Laurea degree in Electrical Engineering**, Università di Palermo, *summa cum laude*. Final thesis about Handover and Admission Control in wireless packet networks, assisted by Prof. Giuseppe Bianchi.

3. Projects

- 2010-2013: **technical Project Manager** for the project FP7-ICT-2009-1.1: FLExible Architecture for Virtualizable wireless future Internet Access (FLAVIA). Total budget: 3.5 Meuro (milion euros); Research Unit Budget: 600 Keuro
- 2012-2015: **project coordinator** for the EU regional project POR Sicilia: Nuove Tecnologie per la Trasmissione Broadcast (TTB) Total budget about 1 Meuro, Research Unit Budget 500 Keuro
- 2013-2015: **project coordinator** for the University of Palermo in the bilateral project MAE Italia-Polonia: ADvanced wifi networks for HOme Customized applications (ADHOC) 2013-2015
- 2013-2015: **research unit coordinator** for the project EU FP7-CREW2012-CO2: The Wireless MAC Processor over CREW: enabling Cognitive Access BenchmarkING (CABIN-CREW). Total Budget 120 Keuro
- 2012-2015: **task leader** for the national project PON 04 Smart Cities and Communities: Innovation for green EXchange in Transportaton (i NEXT).
- 2006: **research unit coordinator, for the University of Palermo, in the Italian national project PRIN MIMOSA** about: models and methodologies for WLAN measurements and traffic characterization.

- 2006: *research unit coordinator, for the University of Palermo, in the Italian-Greek bilateral project PITAGORA* about: emerging WLAN architectures, mobility management in WLAN, programmable networks.
- 2005-2006: *research collaborator in the Italian national project PRIN TWELVE* about: 802.11 evolutions for QoS support and advanced services.
- 2003-2006: *research collaborator in the Italian national project FIRB PRIMO* about: reconfigurability, quality of service and mobility management in multi-access hybrid systems. In this context, research activity is focused on ad-hoc networks and specifically on QoS support and MAC extensions.
- 2001-2006: *research collaborator in various projects at Università di Palermo* about: mobility management and load balancing in wireless packet networks.
- 2000-2002: *research collaborator in the Italian national project MURST 40% RAMON* about: reconfigurable access networks for mobile computing applications. During this work, she collaborated for the design and implementation of a software module able to abstract handover functionalities and to drive handover decisions among heterogeneous systems.

4. Conference Organization and Tutorials

- General chair of the international conference Privacy in Statistical Databases (PSD 2012), September 2012, Palermo, Italy. (<http://unescoprivacychair.urv.cat/psd2012/index.php?m=organization>).

- Tutorial on Programmability of Wireless Networks, ACM SIGCOM 2012, August 2012, Helsinki, Finland (<http://conferences.sigcomm.org/sigcomm/2012/pwn.php>).

- Co-chair for the workshop multiMedia Applications over Wireless Networks (MediaWin) in the editions 2006, 2007, 2008 e 2009, jointly organized with the international conference European Wireless in 2006 and IEEE ISCC in 2007, 2008, and 2009.

- Co-Chair of the international conference IEEE ISWPC 2010, May 2010, Modena, Italy.

- Local Organizer of the 6th Spain, Italy, and Netherlands Meeting on Game Theory (SING 6), Palermo, Italy, July 2010.

- Local Organizer of the Annual Mediterranean Ad Hoc Networking Workshop (MedHoc) 2011, Favignana, Italy, June 2011.

PARTICIPATION TO TECHNICAL PROGRAM COMMITTEES:

WoWMoM 2006/2007/2010/2011 (World of Wireless, Mobile and Multimedia Networks)

IEEE WCNC 2005/2009 (Wireless and Communication Networking Conference)

IEEE ICC 2010/2011/2013 (International Conference on Communication)

IEEE WONS 2013 (Wireless On-Demand Network Systems and Services)

IEEE WD 2012 (Wireless models and Simulations)

IEEE GLOBECOM 2010/2011/2013 (Global Communication Conference)

IEEE WiFlex 2013 (International Conference on Wireless Access Flexibility)

IEEE INFOCOM 2013 (International Conference on Computer Communications)

REVIEWER for the following main JOURNALS:

IEEE Transactions on Communications, IEEE Transactions on Networking, Journal of Selected Areas in Communications, IEEE Transactions on Vehicular Technology, ACM Wireless Networks, Computer Networks.

PANELS AND INVITED TALKS

- Panel Organizer and Moderator for the Second GENESI Workshop 12th, June 2012, Catania. Panel title: "Challenges

and Opportunities for long-lasting wireless monitoring”.

- Opening Talk "Evolution of the WLAN Access Protocols and Infrastructures" for MediaWin 2006, April 2006, Athens

- Opening Talk "The wild world of WLAN cards: can QoS confide on simulations and models?", Mediawin 2007, Aveiro, Portugal.

- Invited Talk "Dissecting WLAN unexpected performance: from theory to vendor-affected reality" for the Italy-Korea Workshop on Wireless Communication Today and Tomorrow, October 2008, Seoul

- Invited Talk "When your smartphone becomes your guide dog" for the international Workshop "La tecnologia al servizio dell'uomo: soluzioni innovative per aiutare le persone a superare i limiti imposti dalle loro disabilità", organized by the Andrea Bocelli Foundation Pisa, July 2012

(<http://www.andreabocellifoundation.org/?p=446&lang=it>).

PARTICIPATION TO OTHER COMMITTEES at the UNIVERSITY OF PALERMO:

- Scientific Coordinator of the Palermo Research Unit in the Consorzio Nazionale Inter-universitario per le Telecomunicazione (CNIT)

- Technical committee for the evaluation of the proposals for the internal research funding;

- Technical committee for the evaluation of the teaching quality (2006-2010).

5. Teaching Experiences

1. At the University of Palermo, mainly in the field of Communication and Information Theory. In particular:

a. Wireless Networks for Undergraduate Students

Regular course of 50 hours in the Academic Years 2005/2006, 2006/2007

b. Wireless Networks for Graduate Students

Regular course of 60 hours in the Academic Years 2006/2007, 2007/2008, 2008/2009, 2009/2010;

Regular course of 90 hours in the Academic Years 2010/2011, 2011/2012, 2012/2013

c. Computer Networks for Students of the old Laurea Program

Regular course of 60 hours in the Academic Year 2006/2007.

d. Queuing Theory.

Regular course of 40 hours in the Academic Year 2011/2012.

e. Telecommunication Systems.

Part of the course (30 hours) in the Academic Years 2009/2010 and 2011/2012.

f. Local Area Networks for Home and Building Automation

Regular course (30 hours) within the Master Program for Experts in Domotic Applications, coordinated by Prof. M. Ippolito.

g. Numerical Signal Processing

Practical lessons (15 hours) in the Academic Years 2001/2002 and 2002/2003, about MATLAB software use for filter design, analysis of quantization effects, spectral estimation, kalman filters.

h. Object Oriented Programming and distributed applications (C++, JAVA).

Practical lessons (15 hours) in the Academic Years 2002/2003, 2003/2004.

2. Courses in other schools

a. Computer network

Compact course for the Center of Research Electronic in Sicily (CRES) held in October/November 2006;

b. Numerical Signal Processing

Compact course for the Center of Research Electronic in Sicily (CRES) held in October/November 2005;

c. Evolution of Wireless Local Area Networks

Compact course (12 hours) at the University La Sapienza di Roma, invited by Prof. Chiara Petrioli, in December 2006 and December 2007.

d. Performance study of IEEE 802.11 networks

Seminars (8 hours) at the Seoul National University, Korea, invited by Prof. Sunghyun Choi, June 2007.

e. Evolution of IP Networks

Compact course (20 hours) at the ITALTEL S.P.A. Education Center, October 2007.

3. Other teaching activities

a. Coordinator of the Erasmus Program for the Students in Telecommunication Engineering

b. Thesis supervision: from 2005 to today, supervisor of more than 50 Master Thesis, co-supervisor of 2 Ph.D Students, currently supervisor of 6 Ph.D. students, mostly about: handover algorithms and mobility management, scheduling policies in wireless networks, quality of service in IEEE 802.11 networks, load balancing algorithms in wireless packet networks, cognitive and programmable networks.

6. Research Activities

Mainly about wireless networks. The research activities have been based on: i) the definition of new network ARCHITECTURES and the design/development of the relevant prototypes; ii) the definition of new ANALYTICAL MODELS for characterizing the emerging wireless access solutions, iii) the design of new EXPERIMENTAL frameworks and BENCHMARKING solutions for comparing analytical, simulation and experimental results, iv) the analysis of COMPLEX NETWORK SYSTEMS by means of simulators and system theory. For dealing with these activities, Ilenia Tinnirello has extensively worked on developing custom-made object-oriented network simulators, using simulation tools shared in the research community, designing new drivers/firmware for network cards, designing a new wireless node prototype on a FPGA board.

DETAILS ABOUT THE RESEARCH WORK

1. ARCHITECTURES

- a. New flexible architectures for next generation access networks. This research activity, mainly carried out within the EU project FLAVIA, lead to the definition of a new powerful architecture for programming the behavior of the wireless cards [3] even in terms of low-level medium access operations. The key idea of the approach is an opportunistic splitting between the card ‘primitives’ (i.e. elementary operations hard-coded on the card) and protocol logic control (i.e. the MAC program, that can be composed in terms of an abstract state machine). Thanks to the introduction of a MAC interpreter, called MAC Engine [1, 7, 9], it is also possible to easily implement different virtualization strategies [2] and cognitive paradigms, including the possibility to negotiate, distribute and activate new MAC protocols [5] in the network. The approach has been validated by means of the design and development of a MAC Engine prototype working on an ultra-cheap commercial card. The work has received a significant attention in several important conferences and industrial fora (such as INFOCOM 2012, SIGCOMM 2012, WiFi Summit 2012, WINTECH 2011, etc.), as documented by the downloading of the prototype code and documentation.
- b. Programmable Handover and Load Balancing. This work has been carried out during the initial research activities (it is indeed part of Ilenia Tinnirello’s Ph.D. Thesis). New metrics for quantifying the network load and driving the handover decisions have been proposed [72, 73, 74]. It has been shown that the new decision metrics allows to significantly improve the network performance and reduce the impact of different network configuration parameters (such as the cell overlapping ratio, the transmission power used by the model station, etc.) on the overall performance [63]. By abstracting the decision metric, we also contributed to the definition of a framework [65-67] for making the handover algorithm programmable. Finally, we extended the framework in case of heterogeneous access networks [58] by defining a platform-independent handover logic, decoupled by the platform-specific monitoring functions.

2. MODELS

- a. Analytical Models for medium access protocols. This activity has been focused on the understanding of the DCF extensions for supporting quality of service (EDCA) and to the DCF performance optimization in several network contexts. Starting from the bi-dimensional Bianchi’s model for DCF [15], we proposed an alternative and more general approach for deriving the channel access probability. The key idea of the approach is decoupling the model of the backoff decrement from the contention window updates [55]. We also proposed a completely different and powerful model for EDCA systems, in which station access rules are no more modeled in terms of an equivalent p-persistent protocol [16]. The model is able to also work under non-saturated traffic conditions and several heterogeneous parameters between the contending stations [16, 40, 49, 50, 64]. A last modeling activity has been dedicated to the quantification of the benefits introduced by the new cumulative acknowledgement schemes and burst transmissions [13, 38, 51, 53, 54, 60]. Finally, to better understand the differences between DCF and EDCA, we evaluated low-level performance figures by means of simulations [36, 41, 43, 46, 56, 64, 68].
- b. Estimation of the congestion state in distributed network. We introduced the concept of network state for quantifying the cell load in distributed access networks [69, 71]. Specifically, for IEEE 802.11 networks, we proposed a methodology for estimating the number of competing terminals on the basis of channel observations. The methodology is based on a Kalman-based filtering technique applied to measurements independently carried out by each contending station [69]. The filtering is combined with a change-detector filter (based on a CUSUM test) for promptly identifying the arrival or the departure of each station. The metric has been used for also improving the routing in multi-hop networks [28]. Recently, the approach has been generalized to networks affected by channel errors, in order to better estimate the interference conditions suffered in these networks, by discriminating between collisions and channel impairments [14, 30, 33].

3. EXPERIMENTAL ACTIVITIES

- a. Comparison between experimental and analytical/simulation results for 802.11 network benchmarking. We tried to motivate the discrepancies between theoretical performance results (provided by models and/or simulations) and experimental results in 802.11 networks [45, 57]. Specifically, we proposed a methodology for assessing the backoff behavior of 802.11 commercial cards [47] for distinguishing between unexpected card behaviors due to implementation limits from malicious non-standard behaviors [32]. We identified anomalous backoff behaviors [39], ineffective (proprietary) antenna diversity schemes [27] and arbitrary ambient noise immunity solutions [22, 29-31], by also enlightening serious coexistence problems between cards produced by different vendors. Benchmarking problems for cognitive networks has also been recently considered within the new EU Project CABIN-CREW.
 - b. Hardware and Software prototypes: The methodological analysis has been enabled by the design and development of a radio sniffer, able to detect channel idle and busy states. We also contributed to design and implement from scratch an 802.11 medium access protocol over FPGA for benchmarking purposes and for testing protocol extensions (with time critical requirements) in actual tests [39]. Recently, we worked on the prototyping of the Wireless MAC Processor, i.e. a new architecture for MAC protocol execution based on a MAC interpreter and MAC programs defined in terms of extended state machines [1].
4. COMPLEX NETWORK SYSTEMS
- a. Implications of wireless network flexibility. This research activity has shown the potentialities [14, 15, 16, 26] and the risks [11, 22-25] emerged in the context of highly programmable wireless networks with several interacting nodes. Indeed, because of the proliferation of open-source drivers and growing interest for cognitive networks, modern wireless cards offer the opportunities to access and configure several card internal parameters. Although this flexibility allows to dramatically improve the card capabilities to monitor and react to different operation conditions [14-16, 20] and specific network contexts (such as topologies and services) [26], it also creates several consistency problems between different network nodes. For example, this flexibility can be exploited for implementing selfish behaviors [6, 22-26] non compatible with standard solutions [22]. We proposed to study these conflicts by means of game theory for characterizing network equilibrium conditions and proposing mechanisms able to prevent too greedy access behaviors [6].
 - b. New medium access solutions for improving the resource utilization under emerging multi-hop topologies and PHY technologies. New resource sharing solutions have been proposed and analyzed, in order to better interact with the emerging PHY and multi-hop topologies (with several hidden nodes). Specifically, a new cross-layer MAC/PHY scheme based on OFDMA [8, 42, 44] has been designed by formulating the resource allocation problem in terms of a linear programming problem. A similar cross-layer approach has been applied to power-line networks, due to the similarity between wireless and power-line channel impairments. In this case, the access scheme has been defined in terms of a hybrid reservation/polling scheme tuned on the basis of the estimated channel features [62]. For multi-antenna stations, new DCF extensions have been evaluated for exploiting multiple trans-receivers at the base stations [52] or separating data and control data in different channels [41, 59]. We also studied some resource allocation problems in a multi-cellular scenario, enlightening the problems arisen by the simultaneous usage of partially overlapping channel [37] and by proposing new frequency planning solutions specific for carrier-sense based networks [35-37]. Finally, hybrid scheduled and contention access solutions have also investigated for energy-limited sensor networks [18, 19] and multi-hop topologies with severe packet loss rates due to hidden nodes [4, 10, 12, 26].
